EXPERIENCE

Software Developer | Apr 2023 - Nov 2023
Kolivan | *Baku, Azerbaijan*

- Developing server-side logic, including business logic and data manipulation.
- Collaborating with cross-functional teams, such as frontend developers and product managers, to define project requirements and ensure smooth integration of frontend and backend components.
- Designing and implementing RESTful APIs to support frontend functionality.
- Working with databases, such as MySQL and PostgreSQL, to design and implement data models and efficiently query data.

PROJECTS

Tinder App Java, Servlet, PostgreSQL, HTML, CSS, Bootstrap, Heroku — GitHub

Step Project Tinder is a Java-based web application built using servlets, aimed at creating a Tinder-like dating platform. The project includes features such as user registration, user profile creation, matching algorithms, and messaging capabilities.

Plane Ticket Booking Java — GitHub

The Step Project Booking app is built with core Java, demonstrating proficiency in object-oriented programming concepts. The app allows users to book plane tickets and manage reservations through a command-line interface.

Employee management system Java, Spring Boot , PostgreSQL, Thymleaf — GitHub

This is an employee management system project built using Spring Boot framework. The system allows for the creation and management of employee profiles, including personal information.

Spring Security JWT Java, Spring Security — GitHub

Spring Security JWT is an open-source project on GitHub that provides a sample application with Spring Boot and Spring Security using JSON Web Tokens (JWT) for authentication and authorization.

Product Inventory Manager Java, Spring Boot, Postgre SQL, Vue js, Swagger — GitHub

The Product-Inventory-Manager is a web application developed with Vue.js and Spring Boot. It enables users to manage inventory and keep track of stock levels in a clean and organized interface.
